TOGETHER WE CAN DEFEAT DENGUE

Dear Residents,

Raining season is here, breeding season for mosquito is also on the rise.

In order to prevent our estate from mosquito infection, all effort are appreciated to help us fight this war front.

To prevent the spread of dengue fever, we must first prevent the breeding of its vector, the Aedes mosquito. The Aedes mosquito prefers to breed in clean, stagnant water easily found in our homes. You can get rid of the Aedes mosquito by frequently checking and removing stagnant water in your premises.

Some preventive method

- 1) Turn pails and watering cans over and store them under shelter.
- 2) No tray or receptacles should be placed beneath and/or on top of any air-conditioning unit so as not to create a condition favorable for mosquito breeding.
- 3) Remove water in plant pot plates. Clean and scrub the plate thoroughly to remove mosquito eggs. Avoid the use of plant pot plates, if possible.

Residents are most welcome to feedback to management office if you identify or suspect any potential breeding site for mosquito in the estate. Any further query, we can be reach at Tel: 67958018 during office hour and 67951353 after office hour.
